Ultra High-Accuracy Laser Displacement Sensor

CDX series

New models added

World’s No. 1 Linearity

OPTEX FA CO., LTD.
A fusion of ultra high-accuracy and ease-of-use

We have accumulated decades of know-how since our first laser displacement sensor was introduced to market, all which have been utilized to achieve the World’s No. 1 measurement accuracy. We arrived at a simple configuration by examining various user needs and are able to provide operability by way of a built-in Web server, a new concept for displacement sensors. Featuring a fusion of ultra high-accuracy and ease-of-use, these laser displacement sensors feature an extremely high level of perfection.

In order to enable ultra high-accuracy measurements to be performed, a specially-designed optical system and rigid body with an independent base unit structure have been adopted. Featuring advanced levels of both accuracy and high speed, causes of errors have been successfully shut out.

Linearity has been successfully restrained through use of a newly-developed original measurement algorithm. By performing a thorough review of our algorithm, ultra high-accuracy measurements have been achieved.

Featuring unprecedented linearity thanks to an advanced optical system and highly-rigid body

Advanced Opto-technology & High-rigidity design

New algorithm

By performing a thorough review of our algorithm, ultra high-accuracy measurements have been achieved.

Featuring the World’s No. 1 linearity that easily satisfies the [+/-0.015% F.S.] catalog specification, CDX series models realize measurements with significantly higher levels of accuracy than the conventional model.

*Example with the diffuse-reflective type

Ultra High-Accuracy Laser Displacement Sensor

* For triangulation method diffuse-reflective type displacement sensors.

Optex FA examination performed November 2016.

World’s No. 1 Linearity Series CDX

The light receiving lens has been customized to enable light reflected from the measurement target to be focused with high accuracy on the light receiving element. Error-causing spot distortions that arise due to lens aberration have been decreased significantly.

Neo LD: Neo Low Dispersion

Linearity comparison

* Workpiece angle: +/-0°, diffuse mode.

Refer to P. 10 for measurement conditions.

Featuring the World’s No. 1 linearity that easily satisfies the [+/-0.015% F.S.] catalog specification, CDX series models realize measurements with significantly higher levels of accuracy than the conventional model.

The light receiving lens has been customized to enable light reflected from the measurement target to be focused with high accuracy on the light receiving element. Error-causing spot distortions that arise due to lens aberration have been decreased significantly.

Neo LD: Neo Low Dispersion
Newly Developed Image Sensor for Highly Accurate, High-speed, and Stable Measurements

**Newly developed image sensor: ATMOS**

In order to achieve the World’s No. 1 Linearity, ATMOS image sensors were newly developed with a light receiving element featuring a CDX specialized design. By applying the latest technology, accuracy has been increased by 3.3 times* that of the conventional model.

*Comparison between the CDX-W85 and conventional equivalent model

**Feedback-free high-speed shutter**

With conventional image sensors, feedback control to the shutter could not keep up with sudden changes in receiving light levels caused by changes in workpiece colors. Momentary inabilities to perform measurements would be caused, resulting in response delays. With newly developed ATMOS image sensors, measurements can be performed without the need for feedback control thanks to an industry-first algorithm. Because momentary inabilities to perform measurements and response delays have been eliminated, real-time measurements are now possible.

**Stable measurements even with Class 1 lasers**

With ATMOS image sensors, stable measurements are possible even with a Class 1 laser thanks to their high level of sensitivity. Even when measuring black workpieces such as tires, highly accurate measurements can be performed without using a high output laser. Stable measurement of black workpieces is possible while ensuring the safety of worker’s eyes.

**High-speed measurement: Max. sampling period of 12.5 μs (Measuring frequency: 80 kHz)**

With highly sensitive ATMOS image sensors, ultra high-speed shutter speeds are possible as the required exposure time is minimized. Because sampling periods have been reduced to 12.5 μs, 1/8th of the conventional model, these sensors can be utilized for application that require ultra high-speed measurements.

*With a sampling period of 12.5 μs, the measurement range will be limited. For details, refer to P. 10.
Applications

Shape measurement of cam shafts

Shape measurement of tires

Deflection measurement of large diameter drills

Flatness measurement of transmission parts

Height inspection of smartphone frames (specular reflection type)

Warpage measurement of glass substrates (specular reflection type)

Newly Developed Image Sensor for Highly Accurate, High-speed, and Stable Measurements

Applications

- Shape measurement of cam shafts
- Shape measurement of tires
- Deflection measurement of large diameter drills
- Flatness measurement of transmission parts
- Height inspection of smartphone frames (specular reflection type)
- Warpage measurement of glass substrates (specular reflection type)

Newly developed image sensor: ATMOS

In order to achieve the World’s No. 1 Linearity, ATMOS image sensors were newly developed with a light receiving element featuring a CDX specialized design. By applying the latest technology, accuracy has been increased by 3.3 times* that of the conventional model.

ATMOS: Auto Tuning cMOS

*Comparison between the CDX-W85 and conventional equivalent model

NEW

Height inspection of smartphone frames (specular reflection type)

Flatness measurement of transmission parts

Applications

- Shape measurement of cam shafts
- Shape measurement of tires
- Deflection measurement of large diameter drills
- Flatness measurement of transmission parts
- Height inspection of smartphone frames (specular reflection type)
- Warpage measurement of glass substrates (specular reflection type)

Feedback-free high-speed shutter

When receiving light level changes suddenly

Laser class 1: Designed to be inherently safe. Light is collected optically, ensuring a safe level even when the laser is emitted to the human body (eyes and skin).

Conventional feedback type

Real-time measurement

Response delay

Workpiece height difference

With conventional image sensors, feedback control to the shutter could not keep up with sudden changes in receiving light levels caused by changes in workpiece colors, momentary inabilities to perform measurements would be caused, resulting in response delays. With newly developed ATMOS image sensors, measurements can be performed without the need for feedback control thanks to an industry-first algorithm. Because momentary inabilities to perform measurements and response delays have been eliminated, real-time measurements are now possible.

Got Questions? 1-800-280-6933
Direct Network Connections are Possible without Use of a Controller

**NEW**

Direct Ethernet connection

Because an Ethernet serial interface is built-in to the sensor head, connection to a network is possible without use of a controller. Not only can the cost of a controller be eliminated, but any worries about securing space for controller installation can also be forgotten.

- No controller required. Simply add new sensors to the hub.

- Operation is possible by connecting directly to a PC LAN port

- Of course, connection to a PLC Ethernet port is also possible

**When Analog/Control Output is Necessary**

Displacement sensor amplifier unit CDA-M

The CDA-M amplifier unit is equipped with an organic EL display on which both Japanese characters and English lettering can be viewed with clarity. Control can be performed using either analog or control outputs, while thickness and height difference measurements can be performed using two sensor heads.

- Operation is possible by connecting directly to a network.
- Masking of unnecessary areas can be performed. Use is possible without need for a dedicated computer software.
- Connection to a PLC Ethernet port is also possible.
Equipped with a Web Server

Setup software is unnecessary

The CDX series features a new Web server. Using a web browser on the computer connected to the same network, browsing and controlling measured values and setup contents are possible. Use is possible without need for a dedicated computer software. Supported browsers: Internet Explorer Ver.11 and above, Google Chrome 49 and above

Main functions

- Distance monitor
  Simultaneous display for 4 CHs

- Storage
  No data logger required

- Light distribution
  Masking of unnecessary areas

With the CDX series, judgment settings can be configured for channels 1 to 4. The measured values for each channel can be displayed at once on a graph, allowing for simple comparison of measurement data. Moreover, monitoring of speed and thickness of transparent objects in addition to displacement is possible simultaneously.

Measured values for up to 100,000 points can be stored. By operating using a browser, data can be viewed and CSV files can be downloaded.

By monitoring receiving light waveforms, receiving light levels and mounting angle can be confirmed. Thanks to a newly developed mask function, even if there are unnecessary objects or ambient light in the measurement range, those can be masked to enable measurements to be performed free of influence.

Other functions

- Measurement setting
- I/O setting
- Device setting
- Communication setting
- Product information etc.

Laser class

Temperature

Ambient temperature: 25°C (normal temperature), Supply voltage: 24 VDC, Sampling period: 50 μs, Moving average performed: 256, Median filter: 31, Center of measurement range, Measurement target (specular reflection: glass) for the 15 mm/30 mm type, (specular reflection: aluminum vapor deposition mirror) and (diffuse reflection: visible light shielding ceramic) for the 85 mm type. Furthermore, the sensor head is fixed in place with an aluminum jig when measurements are performed.

Environmental conditions

The measurement conditions are as follows unless otherwise designated.

Ambient temperature: 25°C (normal temperature), Supply voltage: 24 VDC, Sampling period: 50 μs, Moving average performed: 256, Median filter: 31, Center of measurement range, Measurement target (specular reflection: glass) for the 15 mm/30 mm type, (specular reflection: aluminum vapor deposition mirror) and (diffuse reflection: visible light shielding ceramic) for the 85 mm type. Furthermore, the sensor head is fixed in place with an aluminum jig when measurements are performed.

*1. The measurement range will become narrower when the sampling period is set to the maximum speed of 12.5 μs. Please use by selecting from Near/Center/Far below.

1. In accordance with the FDA provisions of Laser Notice No. 50, the laser is classified as Class 1 per the IEC 60825-1:2007 standard.
2. Defined with linear strength 1.0 mW (10.5 mW) at the center of measurement range. These may be leak light other than the specified spot size.
3. The sensor may be affected when there is a highly reflective object close to the detection area.
4. The minimum stop that can be identified when the distance between the sensor and target changes one step at a time (when performing moving average 65,536 times)
5. Peak-to-peak value of measured value when measuring in stationary state (when performing moving average 65,536 times)

System Configuration

Ensure that the overall cable length from the power supply to the sensor head is within 30 m, and the number of Sensor Head Extension Cables to be connected must be up to two. Also ensure that the overall cable length when the CDA-M amplifier unit is used is within 10 m. (This length restriction does not apply to the Ethernet cable.)
